How to Grow Iris

Irises may be grown very successfully in Southern gardens if proper growing conditions are provided for them, and, in selecting the particular types that are best suited for your garden, consideration should be given to location and soil. In the planting instructions given below we have emphasized the requirements of each type.

German Irises require a well-drained, sunny location. Clay soils should be mixed to a depth of 1 foot with a liberal quantity of sharp sand. Do not plant too deep. The top of the rhizomes should be at ground-level. Use no fertilizer except Bone Meal, about a closed handful to each plant, and after planting, water thoroughly to settle soil. Cultivate the surface after each rain and water only when soil is dry. Remove old leaves as they wither sufficiently to pull them off. Proper distance between plants, 1 foot.

Louisiana Irises do equally well in sunny or partially shaded locations if properly watered. Clay soils should be loosened by spading in a liberal quantity of Peat Moss. Plant the roots about 4 inches deep and 1 foot apart. Leave them undisturbed in the ground until they are crowded for space, when they should be lifted and separated. This is best done in late summer or fall.

Japanese Irises may be grown very successfully in the South by observing a few simple rules. They prefer a sunny location, but are not adverse to semi-shade. In preparing your bed, spade into the soil a liberal supply of well-rotted cow manure and Peat Moss. Plant the roots 3 to 4 inches deep, and in order to provide sufficient moisture during warm weather, dike your beds so the water will not run off. Never allow the soil to dry out. Give a good soaking whenever needed.

Reuter's Everblooming Roses

We offer California Roses grown for us by one of the largest and most reputable growers on the West Coast. All plants offered are large, hardy, 2-year-old, field-grown, budded stock, full of vigor. They have been blooming profusely this past season.

All Tea (T) and Hybrid Tea (HT) Roses are everblooming in the South. Hybrid Perpetuals (HP) are more seasonal in their blooming.

CULTURAL DIRECTIONS. Select a location where your Roses will get the sun at least 5 to 6 hours a day. They do best in a slightly acid ground and if your soil is alkaline it is advisable to give the Rose-beds an application of Aluminum Sulphate before setting out the bushes. Broadcast, this material over the surface at the rate of 10 pounds per 100 square feet, and mix it into the soil by spading. For easy cultivation and cutting of flowers do not make your Rose-beds more than 3 feet wide, and set your bushes 1½ feet apart each way.

About the end of February the Rose bushes should be pruned. Cut the plants back to about 12 inches; remove all dead wood and weak and unproductive growth. Climbing Roses if cut back at all should be pruned about the beginning of July. Some growers object to severe pruning, in which case remove only the dead wood or unproductive growth.

Give your first application of plant-food about the middle of February and continue monthly until June. Apply a closed handful to each bush sprinkled over the surface and watered down.

Spraying is very necessary to protect the plants from black-spot, mildew, and insects. Tri-Ogen or Nicotine Pyrox are probably the most efficient of all the spray materials as they control the fungus and kill all types of insects.

In the spring a mulch of some kind is of great importance. Such material as Peat-Moss or Servall is suitable for this purpose. During dry weather give your Rose-bed a thorough soaking twice a week. Light daily sprinklings are of little benefit.

Will produce a beautiful and luxuriant solid carpet of grass within two weeks. Sow at the rate of 1 pound to 75 to 100 square feet. On new lawns a rake can be used in mixing the seed into the surface soil. When sowing on a Bermuda or Carpet lawn the grass should be mowed as closely as possible before sprinkling the seed, and for better germination the lawn should be given a light covering with good soil or Peat Moss. **Lb. 25c.; 5 lbs. \$1.00, postpaid.** Not prepaid: 10 lbs. \$1.40; 25 lbs. \$3.25; 100 lbs. \$12.00.

829 FANCY BERMUDA GRASS

The most dependable Summer Lawn Grass for Southern gardens. Makes a tough, even, clumpless turf that recovers quickly after cutting. Lasts for years and stands long, hot, dry summers without injury. Succeeds on nearly all types of soil. Germinates in 20 to 30 days with proper soil-moisture. For good, heavy stand, sow at the rate of 5 pounds to 1000 square feet, from March to September. The seed can be sown on top of your winter grass after mowing same closely. Pass a rake over the grass to prevent the fine seeds from sticking to the blades. Although a perennial, the top of Bermuda Grass dies down during cold winters, but will come up again the next spring. The Bermuda Grass seed we offer is the finest, leaf-cultivated, turf-producing strain, testing 98 per cent purity or better. **Lb. 90c.; 5 lbs. \$4.25, postpaid.** Not prepaid: 10 lbs. \$7.00; 100 lbs. \$65.00.

826 HULLED BERMUDA GRASS

Reuter offers his extra-fancy Bermuda Grass with the hulls removed, a new process which gives much quicker germination. Under favorable moisture and soil-conditions, Reuter's Hulled Bermuda Grass will germinate in 8 to 10 days, almost as quick as Rye Grass. It is more economical because half the quantity is necessary to sow 100 square feet of lawn. Be sure to specify hulled seed when ordering, as otherwise the unhulled seed will be shipped. **Lb. \$1.30; 5 lbs. \$6.00, postpaid.** Not prepaid: 10 lbs. \$10.50.

838 REUTER'S GULF-STATE LAWN GRASS MIXTURE

A perfected formula of the finest, purest, heavy, recleaned, live seeds, free of chaff and weed seeds, prepared by Reuter after years of experimental work with grasses adapted to Southern soils and climatic conditions. With proper care and attention, it will quickly produce a beautiful, velvety green, all-year-round lawn capable of standing winter cold and summer heat and drought. Five pounds will sow 1000 square feet (50 x 20 feet). Plant liberally if you wish a thick luxuriant lawn. **Lb. 75c.; 5 lbs. \$3.50, postpaid.** Not prepaid: 10 lbs. \$5.50; 100 lbs. \$50.00.

830 CARPET GRASS

Splendid Lawn Grass for the South. Better than Bermuda for poor, sandy soil and semi-shady lawns. It is a perennial, spreading by creeping stems which root at every joint, thus forming a close, compact turf. Germinates in 20 to 30 days if soil is kept properly moist. For a closely matted lawn, sow at the rate of 5 pounds per 1000 square feet from March until July. Like Bermuda Grass, the seed may be sown on top of your winter lawn after close mowing. Reuter offers only stock that has been carefully analyzed for purity and germination in our own modern Seed Laboratory. **Lb. 60c.; 5 lbs. \$2.50, postpaid.** Not prepaid: 10 lbs. \$4.00; 100 lbs. \$38.00.

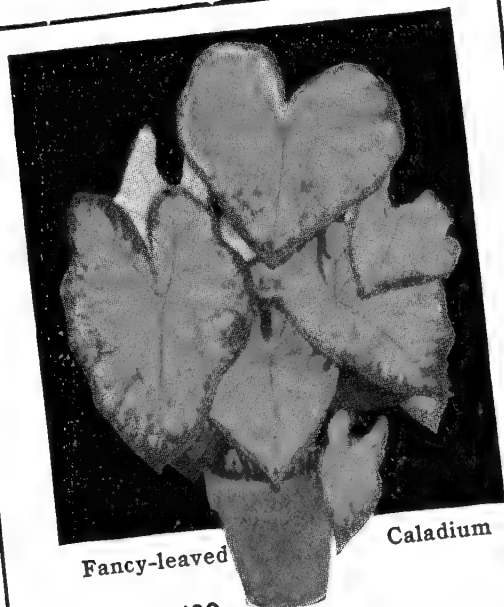

ST. AUGUSTINE GRASS

In Florida, and to an ever-increasing extent in New Orleans, the shady lawn problem has been solved by the use of this perennial creeping grass. It is a deep green, broad-bladed grass, creeping by means of surface runners. Somewhat similar to Carpet Grass, except it has a better color and stays green during ordinary winters. Seed is not available, but lawns are established with rooted runners, laid down in parallel trenches about 8 to 10 inches apart and 2 inches deep, with a flat slope on one side and nearly vertical on the other. A bushel will plant from 150 to 200 square feet, depending on how close it is set. Not prepaid: Bus. \$2.25; 10 bus. \$20.00.

REUTER'S GARDEN SUPPLIES

PALCO PETE'S MULCH

This excellent mulching material comes from the giant Redwood trees in California. It is a finely shredded and pulverized bark which readily mixes with all types of soil and does not easily decompose. Hence it lasts longer and keeps soil particles from becoming compacted and lumpy over extended periods of time without necessitating frequent applications.

As a surface cover, Palco Pete's Mulch blankets the soil and roots from the drying effects of sun and wind, retarding excessive capillary action and checking evaporation. Moreover, when the weather is hot, it tends to keep the soil from baking and cracking.
